Evidence Quality Rubric (v1)

Each selected code gets four scores, one per dimension; codes not selected get one search score. There is no overall band yet: bands will be set after the first annotation round, once the score distribution is known. The rating never changes a code.

How to rate

1. For each selected code, score V, S and P on the source you would quote first, and C across all its sources.
2. Record each score separately. Do not add them up or assign a band.
3. Give one Search score for the codes not selected.
4. N/A, none documented, and not reported, codes get no rating.

The four dimensions

V is the core: does the source show the fact, or only say it? V runs 1-3 because every cited source at least states the fact.

Dimension	Coding question	Allowed scores	Decision rule	Score definitions
V. Verifiability	Does the evidence show the fact holds, or only state it?	1 Stated; 2 Inspectable; 3 Confirmed	Rate what an outsider could check today. Plans and promises count as Stated; write "promise" in the comment.	1 Stated: a claim or promise no outsider can check; 2 Inspectable: an outsider can check it (code, public items, logs, or the page itself for disclosure codes); 3 Confirmed: someone other than the source checked it and documented the result
S. Source independence	Who made the claim, and do they have a stake in it?	0 Unattributed; 1 Interested or informal; 2 Operator official; 3 Independent	Rate who wrote this piece of evidence, not who hosts it. This rates the source, not the benchmark's ties (those are coded in Evaluator-provider ties).	0 Unattributed: author unknown; 1 Interested or informal: the evaluated provider or funder, or operator staff on a forum or social media; 2 Operator official: the operator's site, paper, repository or changelog; 3 Independent: an outside party you checked and found no ties

P. Precision and fit	Does the evidence cover this code, for this version?	0 Off-target; 1 Adjacent; 2 On-target; 3 Exact	Evidence that needs an inference scores at most 1.	0 Off-target: a different benchmark or property; 1 Adjacent: an earlier version, a sibling tier, operator-wide practice, or unclear whether it counts as evidence for the code; 2 On-target: this benchmark and code, without specifics; 3 Exact: this version, with checkable specifics (counts, dates, IDs)
C. Corroboration	Do other sources agree?	0 Contradicted; 1 Single; 2 Same party; 3 Cross-party	Count sources, not copies. Silence is not agreement.	0 Contradicted: an unresolved conflict (tag the code Unclear); 1 Single: one source; 2 Same party: separate sources from the same party agree; 3 Cross-party: a source from a different party agrees

Search completeness

Dimension	Coding question	Allowed scores	Decision rule	Score definitions
Search completeness	How thoroughly did you search before concluding a code has no support?	0 Minimal; 1 Partial; 2 Complete; 3 Targeted	Core sources: benchmark page, paper, code repository, docs or FAQ, changelog, operator posts, dataset card. Name any that don't exist. Evaluator-provider ties and Section 5 also need a web search for a 2.	0 Minimal: one or two core sources; 1 Partial: at least one core source skipped; 2 Complete: every core source checked; 3 Targeted: as 2, plus a keyword search for the missing concept and a web search

Rules and red flags

- For codes about what is stated (for example, Privacy rationale), the quote proves the code; V rates whether practice matches the statement.
- When torn between two scores, take the lower one.
- Comment on any red flag: a claim made only after the controversy it addresses; numbers that differ across sources; a live page that differs from its archived copy; a source vouching for itself with no artifact.
- Write "Excerpt" in the comment when a source was read only as a search snippet or another source's quote.

Annotator question

Evidence quality. Rate the evidence for this variable using the Evidence Quality Rubric. For each selected code, give the four scores (V, S, P, C). Give one Search score for the codes not selected. Comment only when S, P or C is 0, a source was read as an excerpt, or a red flag applies.

<Code>: V_ S_ P_ C_
Not selected: Search _
Comment: <only when required>

Worked examples (FrontierMath Tiers 1-3 v2)

Code	Scores	Deciding reason
Scoring transparency: Metric/formula public	V2 S2 P3 C2	The scoring rule and scorer code are public and checkable
Protected component: Labels/reference answers	V1 S2 P1 C2	The withheld solutions can't be inspected, and the count is for a pre-v2 version
Privacy rationale: Adaptive gaming/overfitting	V1 S1 P2 C1	The only source is a co-founder's forum comment, written during the January 2025 controversy
Durability controls: codes not selected	Search 2	Every core source checked; no keyword or web search
